                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  consider the repeating sequences. The detection and analysis of polymorphisms of greatest passed upon the genetic profile of individual patients. CC this would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. CC Methods of the invention are also useful in the drug discovery and capproval processes. For example, individuals could be selected for CC clinical trials only if their genetic profiles indicate that they are CC capable of responding to a particular drug orders, and previously cfailed drug candidates could be revived if they were matched with more CC appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of CC possible drug targets and decreases in the number of adverse drug consistency from the methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to methods for haplotyping cholinergic receptor, nicotinic, beta polypeptide 3 (CHRNB3) gene. The invention also provides single nucleotide polymorphisms (SNP) in the human CHRNB3 gene. Folymorphic variants of CHRNB3 gene is used for screening for candidate drugs to treat diseases related to CHRNB3 activity. They are also useful in studying the effect of variation on the biological activity of CHRNB3 as well as on the binding affinity of candidate drugs targeting CHRNB3 as well as on the binding affinity of candidate drugs targeting CHRNB3 for treating Alzheimer's disease and other neurological disorders. They are also useful in gene therapy. Compositions comprising CHRNB3 gene polymorphic variants are useful for genotyping and/or haplotyping and CHRNB3 gene in an individual. The present sequence is an allele-specific oligonucleotide (ASO) primer used to detect human CHRNB3 gene polymorphisms. Human CHRNB3 gene includes 8 polymorphic sites PS1-PS8
                             The invention relates to methods for haplotyping glycoprotein Ib (platelet) alpha polypeptide (GPIBA) gene of an individual. The method involves determining if the individual has one of the GPIBA haplotypes haplotype pairs. The methods of the invention are useful for disease diagnosis and in the discovery and development of drugs for treating diseases associated with GPIBA activity e.g. Bernard-Soulier syndrome, platelet-type von Wilebrand disease, HIV and Alzheimer's disease. The present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is allele-specific oligonucleotide (ASO) primer used for the present sequence is all the present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; haplotyping; glycoprotein Ib (platelet) alpha protein; GPIBA Bernard-Soulier syndrome; platelet-type von Willebrand disease; HIV Alzheimer; s disease; allele-specific oligonucleotide; polymorphism; primer; human immunodeficiency virus; ASO; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New haplotypes of the glycoprotein Ib platelet alpha polypeptide gene useful for diagnosis and drug discovery for treating Bernard Soulier syndrome, platelet-type von Willebrand disease, HIV and Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 15

                                                                                  Query Match
                                                                                                                                      The present invention describes an isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for aldo-keto reductase family 1, member B1 (AKR1B1) gene or its fragment, having the 22214 base pair sequence given in ABL01105. AKR1B1 has antidiabetic activity and can be used in gene therapy. AKR1B1 can be used in the treatment of diabetes. The human AKR1B1 gene is located on chromosome 7935. ABL01107 to ABL01129 represent allele-specific oligonucleotide (ASO) probes used in the detection of polymorphisms in the human AKR1B1 gene; ABL01130 to ABL0117 represent ASO primers used in the detection of polymorphisms in the human AKR1B1 gene; and ABL01176 to ABL01221 represent preferred primers used in the detection of polymorphisms in the human AKR1B1 gene; and ABL01176 to ABL01221 represent preferred primers used in the detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; aldo-keto reductase family 1 member B1; aldose reductase; ss; AKR1B1; chromosome 7q35; detection; polymorphism; ASO; probe; primer; allele-specific oligonucleotide; antidiabetic; gene therapy; diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for aldo-keto reductase family 1, member B1 (AKR1B1) gene or its fragment, having the 22214 base pair sequence given in ABL01105. AKR1B1 has antidiabetic activity and can be used in gene therapy. AKR1B1 can be used in the treatment of diabetes. The human AKR1B1 gene is located on chromosome 7q35. ABL01107 to ABL01129 represent allele-specific oligonucleotide (ASO) probes used in the detection of polymorphisms in the human AKR1B1 gene; ABL01130 to ABL01175 represent ASO primers used in the detection of polymorphisms in the human AKR1B1 gene; and ABL01176 to ABL01221 represent preferred primers used in the detection of

The data about the GPR4 polymucleotides and polypeptides and the polymorphisms associated with them are useful for haplotyping at the GPR4 locus. Allele-specific oligonucleotide (ASO) is useful as probes and primers for assaying a polymorphism in GPR4 gene. The present sequence is an ASO primer used to detect human GPR4 gene polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 15; Page 13; 61pp; English.

The PFKFB2 of the invention has cytostatic and antidiabetic activity. The polynucleotides may have a use in gene therapy. The identified candidate agents targeting PFKFB2, are useful for treating cancer and diabetes. The methods of the invention are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with PFKFB2 activity. The present sequence represents a allele specific oligonucleotide (ASO) probe used in the invention to detect PFKFB2 gene
         The present invention describes an isolated polynucleotide (I) having a sequence (S1) comprising soluble carrier family 18 (vesicular monoamine), member 2 (SLC18A2) isogene selected from 49 isogenes with regions of a sequence (SS) of 40023 bp (see ABL51954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification; or a sequence (S2) complementary to (S1). (I) has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 15 BP; 2 A; 1 C; 9

Methods from the present invention can be used for haplotyping and genotyping the SLC18A2 gene in an individual. SLC18A2 is also known as the vesicular monoamine transporter (VMAT2). (1) is useful in studying the expression and function of SLC18A2, and in expressing the SLC18A2 protein for use in screening for candidate drugs to treat diseases protein for use in screening for candidate drugs to treat diseases related to SLC18A2 activity and in studying the effect of the variation on the biological activity of SLC18A2 as well as on the binding affinity of candidate drugs targeting SLC18A2 for the treatment of respiratory inflammatory diseases such as neuropsychiatric disorders involving monoaminergic brain systems. The present sequence represents an allele specific oligonucleotide (ASO) primer for human SLC18A2, which is given in the present sequence represents an allele specific oligonucleotide (ASO) primer for human SLC18A2, which is given
                           The invention relates to an isolated polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for the amyloid beta precursor protein binding protein 1, 59kD (APPBPI) protein or its fragment. The polymorphic variants are useful in studying the expression and function of APPBPI, in expressing APPBPI protein for use in screening for candidate drugs to treat diseases related to APPBPI activity, in studying the effect of the variation on the biological activity, in APPBPI, and the binding affinity of candidate drugs targeting APPBPI for the treatment of disorders such as Alzheimer's disease. The haplotyping methods are useful in validating APPBPI as a candidate target for treating a specific condition or disease predicted to be associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; amyloid beta precursor protein binding protein 1; APPBP1; probe; Alzheimer's disease; transgenic animal; platelet aggregation; single nucleotide polymorphism; SNP; allele-specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymorphic variants, useful e.g. of APPBP1 and screening candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid beta precursor protein binding protein 159 kD (APPBP1) gene polymorphic variants, useful e.g. in studying the expression and function of APPBP1 and screening candidate drugs for treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo

The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its polymorphic variant of a reference sequence for a CHRM5 cDNA or its cfragment. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of chrys, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the cinvention are useful in developing diagnostic tests and therapeutic contract drugs for treating specific condition or disease associated complete drugs for treating specific condition or disease associated complete drugs for treating specific condition or disease associated complete drugs for treating specific condition or disease associated complete the haplotypes or one of the haplotype pairs. The invention is useful in determining whether an individual conceptual in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping condition of the haplotyping individual. The present nucleic acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The transgenic animals are useful for studying expression the APPBP1 isogenes in vivo, for in vivo screening and testing of dr targeted against APPBP1 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet aggregation in a biological system. ABK32771-ABK32327 represent huma APPBP1 gene allele-specific oligonucleotides used in the method of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens

                                      CC (CHRM5) polynucleotide comprising a sequence which is a polymorphic comprising a sequence which is a polymorphic comprising a sequence which is a polymorphic comprising a sequence for the CHRM5 gene or its fragment, or a CC polymorphic variant of a reference sequence for the CHRM5 cDNA or its comprision of a reference sequence for a CHRM5 cDNA or its complex confidence. The invention is useful in drug screening assays. The molecules CC cHRM5, and in expressing CHRM5 protein for use in screening for candidate comprise to treat diseases related to CHRM5 activity. The methods of the cinvention are useful in developing diagnostic tests and therapeutic conditate drugs for treating specific condition or disease associated comprise the chaptorype so one of the haplotypes or one of the haplotypes or one of the haplotype so one of the haplotypes or one of the haplotype pairs. The invention is useful in genotyping and/or haplotyping condition of allele-specific oligonucleotide (ASO) crobes (ABK81765-ABK81774) that were used in the invention to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    represents one of a collection of allele-specific primers (ABK81775-ABK81794) that were used in the polymorphisms in the human CHRM5 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 15 BP; 2 A; 8 C; 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, cholinergic receptor muscarinic 5; CHRM5; genotyping; haplotyping, single nucleotide polymorphism; SNP; allele-specific oligonucleotide;

ABK81777/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                         The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its fragment. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic treatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in the design of clinical trials of the one of the haplotypes or one of the haplotypes or one of the haplotypes and therapeutic methods. The invention is also useful in genotyping and/or haplotyping the CHRM5 gene in an individual. The present mucleic acid sequence represents one of a collection of allele-specific oligonucleotide (ASO) primers (ABK81775-ABK81794) that were used in the invention to detect

The majority of PWS/Angelman patients are deleted for a common set of markers including ML34, IR4-3R, TD189-1 and TD3-21.
                                                                                                                                                                                                                                                                                                         Sequence 35 BP; 5 A; 9 C; 8 G; 5 T; 0 U; 8 Other;

                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes human GASC1 (gene amplified in squamous cell carcinoma 1). GASC1 has been located to the p23-24 region of human chromosome 9. GASC1 can be used in the diagnosis and investigation of diseases with which cell differentiation and proliferation are associated, such as cancer. It can also be used in gene therapy of these diseases, and screening substances for their ability to modify the expression of GASC1 and for use as drugs. The present sequence represents a PCR primer for human GASC1, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell proliferation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 estimating a treatment response of an individual suffering from cancer to a disease treatment; an antibody directed to an epitope of a RAI gene product; and a kit for use in the method of estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment, comprising at least one primer or probe and optionally amplifying means for nucleic acid amplification. The novel method is useful for estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment. This polynucleotide sequence represents a probe used for detecting single nucleotide polymorphisms in the DNA of human chromosome 19 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method of estimating disease risk or prognosis of an individual by sequence polymorphism analysis, especially polymorphisms in the human chromosome 19q. The invention further relates to: estimating a treatment response of an individual suffering from cancer to a disease treatment; a primer or probe for use in the method of estimating the disease risk or prognosis of an individual or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-OCT-2002; 2002DK-00001500.

                                                                                                                                                                                                                                                                                                                                                                                                              CC variety of detection assays, including hybridisation assays, nucleic acid cc variety of detection assays, including hybridisation assays, nucleic acid cc evaluating and ecreening drugs using genetic polymorphism data. Genetic cc polymorphism data, particularly that relating to single nucleotide cc polymorphisms (SNPs), may be used in studying the relationship between cc DNA sequence variations and human diseases, conditions, and responses to that cause or exacerbate certain diseases, conditions, and responses to that cause or exacerbate certain diseases. SNPs are particularly useful cin the above respects as they are stable in populations, occur in genes encoding drug metabolising enzymes allows the customisation of crequently, and have lower mutation rates than other genome variations cc in genes encoding drug metabolising enzymes allows the customisation of creduce therapies based upon the genetic profile of individual patients. CC greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. CC enable of responding to a particular patient, but would also cc laparoval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more capacitions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27-DEC-2000; 2000JP-00399443

CC encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least compositions for identifying individuals who have at least conjumorphism may be identified in a nucleic acid sample using genes. The copymorphism may be identified in a nucleic acid sample using probes or compared to a sequence selected from ABZ43217-ABZ50887 using a crariety of detection assays, including hybridisation assays, nucleic acid carrays and pcr-based methods. The invention also encompasses methods of carrays and pcr-based methods. The invention also encompasses methods of colymorphism data, particularly that relating to single nucleotide colymorphism data, particularly that relating to single nucleotide colorides. SNPs are also useful as polymorphism markers for discovering genes to that cause or exacerbate certain diseases, conditions, and responses to convags. SNPs are also useful as polymorphism markers for discovering genes to that cause or exacerbate certain diseases. SNPs are particularly useful crequently, and have lower mutation rates than other genome variations converting genes encoding drug metabolising enzymes allows the customisation of cargenese encoding drug metabolising enzymes allows the customisation of cargenese therapetes based upon the genetic profile of individual patients. Compared the invention are also useful in the drug discovery and capproval processes. For example, individuals could be selected for approval processes. For example, individuals could be selected for cappable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more capputations, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; drug metabolising enzyme; gene; drug metabolism; chromosome 22; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-DEC-2000; 2000JP-00399443

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; human; single nucleotide polymorphism; SNP; Cl S subcomponent protein; ClS; alanyl aminopeptidase protein; XPN-PEPL; meprin A beta protein; aminopeptidase P-like protein; KPN-PEPL; tissue kallikrein protein; KiKi; aminopeptidase P protein; MEPIB; soluble guanylate cyclase l alpha-2 subunit protein; GUCYIA2; haplotype angioedema; angioedema-like disorder; paternity testing; cardiovascular diseases; angina pectoris; hypertension; heart failure; myocardial infarction; aneurysm; stroke; embolism; thrombosis; coronary artery disease; artmaratory disease; inflammatory arthritis; haemodialysis; sepsis; inflammatory disease; cough reflex; allergy; asthma; chronic obstructive pulmonary disease; cough reflex; allergy;
                                        The invention relates to an isolated nucleic acid (1) derived from a human gene encoding a protein, such as the C1, S subcomponent protein (C1S), the alanyl aminopeptidase protein (ANPED), the meprin A, beta protein (MREP1B), the aminopeptidase P-like protein (XPN-PBP), the tissue kallikrein protein (KLK1), the membrane bound aminopeptidase P protein (XPN-PBP2), or the soluble guanylate cyclase 1, alpha-2 subunit protein (XPN-PBP2), The nucleic acid comprises at least one polymorphic position, including the alleles, reference alleles and alternate alleles of the single nucleotide polymorphisms, listed in the specification. The
                                                                                                                                                                                                                       New nucleic acid comprising a single nucleotide polymorphism at a specific location, useful in paternity testing, genetic analysis diagnosing, preventing or treating cardiovascular diseases e.g. angioedema or angina pectoris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US2004033582-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-MAY-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADL64137 standard; DNA; 41 BP
polymorphic position resides in a (non)coding position within the genomic sequence of the gene. The polymorphic position residing in a coding position results in a missense or silent mutation of the translated

CC product of the gene. The polymorphic position residing in a non-coding CC position resides within the untranslated region or an intronic region of the gene. Constructing haplotypes using the nucleic acids above further CC comprises using the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease (CC phenotype with the haplotype. The disease phenotype is angioedema or an CC angioedema-like disorder. The nucleic acids, primers and probes are CC useful in phenotype correlations, paternity testing, medicine and genetic CC analysis. The nucleic acids and polypeptides can be used in diagnosing, CC preventing or treating cardiovascular diseases, e.g. angioedema, angina CC pectoris, hypertension, heart failure, myocardial infarction, aneurysm, CC arteriosclerosis, thrombosis, coronary artery disease or sepsis, inflammatory diseases, inflammatory arthritis, asthma, chronic cobstructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, cough reflex, allergies, or cancer. The present sequence represents a human single nucleotide polymorphism (SNP)

AAM53121 to AAM53222 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymorphisms, infection and

AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; single nucleotide polymorphism; SNP; genome; protein therapy; vaccine; probe; diagnostic assay; quantitation; restorative therapy; polymorphic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-NOV-1999;

For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples
                         AAQ95282 and AAQ95283 are a primer pair for the PCR amplification of the simple tandem repeat (STR) corresponding to wg2g4. The STR can be used for treatment and diagnosis in human and veterinary medicine, partic. I genetic characterisation, mapping, linkage studies and analysis/diagnos of acquired disease alleles
Sequence 16
                                                                                                                                 Identifying simple tandem repeat loci in DNA - by screening DNA library to enrich for fragments contg. the repeats before cloning and rescreening, also simple tandem repeats for treatment or diagnosis.
                                                                                                                                                                                           WPI;

                                                                                                                                                                    gene comprises the template. Gene structure can be determined without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence variation analysis. The method is also useful for determining the boundaries between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group I type introns such as Tetrahymena rRNA, where self-splicing occurs in the presence of guanosine cofactor. The present sequence is a primer used for sequencing human CYP450 2C19 cDNA related to the invention
                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using evenly spaced primers or tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 100-300 base intervals and the comprises for the comprise of the gene at about 100-300 base intervals and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; gene structure; phenotypic expression; guanosine cofactor; germline variation analysis; exon-intron boundary; Tetrahymena rRNA; cytochrome P450 2C19; CYP450 2C19; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Determining structure of genes whose sequence is not known from cDNA, sequencing the gene or gene across exon-intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the cDNA of

The present invention describes a molecular sub-typing system (S) for Escherichia coli, which comprises observing and recording variable number transfer repeats (VMTR) repeat arrays in an E. coli DNA sample. Also described: (1) VMTR loci (I) for sub-typing E. coli O157:H7; (2) primers (II) for amplifying (I); (3) amplicon comprising (II) and a locus comprising a VNTR sequence from E. coli O157:H7; (4) multiplex cocktails (III) for multiplex amplification of (I) comprising two or more primers (C (III) for multiplex amplification of (I) comprising two or more primers (C (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR (C comprising typing reagents for maintaining hybridisation and amplification condition in a PCR instrument (C (vit) DNA from an E. coli strain; (6) kits for molecular sub-typing of E. coli O157:H7 strains by multiplex, comprising (III), and amplifying reagents for maintaining hybridisation and amplification condition in a coli O157:H7 strains by multiplex, comprising (III), and amplifying concording the maplifying comparising the primers for amplifying loci comprising VNTR, where the primers have an observable indicator; (b) obtaining single-stranded sample DNA from the C coli sample to be subtyped; (c) combrising the primers, the sample DNA from the PCR instrument to form amplicons comprising the primers and the VNTR; (d) separated ampliforns; and (f) comparising the primers and the VNTR; (d) separated amplicons; and (f) comparing the evaluation to an evaluation of c separated amplicons; and (f) comparing the evaluation to an evaluation of c separated amplicons; and (f) comparing the evaluation to an evaluation of coli. The present sequence represents an E. coli VNTR loci related coli vention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

The present invention describes a molecular sub-typing system (S) for CC Escherichia coli, which comprises observing and recording variable number trandem repeats (NNTR) repeat arrays in an E. coli DNA sample. Also CC described: (I) VNTR loci (I) for sub-typing E. coli DNA sample. Also CC (II) for amplifying (I); (3) amplicon comprising (II) and a locus CC (III) for amplifying (I); (3) amplicon comprising (II) and alocus CC (III); (5) kits for molecular sub-typing of E. coli O157:H7; (4) primers for CC (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR CC comprising primers for VNTR loci in E. coli, and amplifying reagents for CC (III); (5) kits for wolecular sub-typing of E. coli O157:H7 by PCR CC (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR CC (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR CC (III); (5) kits for molecular sub-typing of E. coli O157:H7 strains by multiplex, comprising (III), and amplifying coli comprising (III), and amplifying of E. coli O157:H7 strains by multiplex, comprising (III), and amplifying condition in a coli o157:H7 strain; and (7) sub crains of comprising (III), and amplifying one or more contition in a molecular sub-typing of E. coli O157:H7 strain; and (7) sub crains of comprising (III), and amplifying one or more contition and E. coli strain, where the primers have an observable indicator; (b) obtaining single-stranded sample DNA from the E. coli sample to be subtyped; (c) combrining the primers, the sample DNA from the CC interest for amplifying reagents under hybridising and amplifying conditions in a pCR instrument to form amplicons comprising the primers and the VNTR; (d) separated amplicons; and (f) comparing the evaluation to an evaluation of amplicons bequence yellows and E. coli version to an evaluation of coli. The present sequence represents an E. coli VNTR loci related amplicons explained in the exemplification of the present coli. (S) is useful for subtyping pathogenic E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 2156

RESULT 2157
ADD28836/c
CC Escherichia coli, which comprises observing and recording variable number CC tandem repeats (NNTR) repeat arrays in an E. coli DNA sample. Also Cd described: (1) VNTR loci [1] for sub-typing E. coli (0157:H7; (2) primers CC (III) for amplifying (1); (3) amplicon comprising (II) and a locus CC (III) for amplifying (1); (3) amplicon comprising (II) and a locus CC (III) for multiplex amplification of (1) comprising two or more primers CC (III); (5) kits for molecular sub-typing of E. coli (0157:H7 by PCR CC (III); (5) kits for MOLECULAR sub-typing of E. coli (0157:H7 by PCR CC (III); (5) kits for MOLECULAR sub-typing of E. coli (0157:H7 by PCR CC (III); (5) kits for molecular sub-typing of E. coli (0157:H7 by PCR CC (III); (5) kits for man damplification condition in a PCR instrument with DNA from an E. coli strain; (6) kits for molecular sub-typing of E. (coli (0157:H7 strains by multiplex, comprising (III), and amplifying creagents for maintaining hybridisation and amplification condition in a CC respense for amplifying loci comprising (III), and amplifying one or more crupiancer for amplifying loci comprising VNTR, where the primers or more comprises for molecular sub-typing one or more comprising the primers for molecular sub-typed; (c) combining the primers and the VNTR; (d) separated amplicons by size; (e) evaluation to an evaluation of amplificons obtained by PCR from a known E. coli strain. M1 is useful for coli numbers of the present sequence represents an E. coli VNTR loci related coli numbers of the present sequence which is useful for sub-typing pathogenic E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          À,

typing (M1) an E. coli strain, comprising: (a) obtaining one or more primers for amplifying loci comprising VNTR, where the primers have an observable indicator; (b) obtaining single-stranded sample DNA from the E. coli sample to be subtyped; (c) combining the primers, the sample DNA and amplifying reagents under hybridising and amplifying conditions in a PCR instrument to form amplicons comprising the primers and the VNTR; (d) separated amplicons by size; (e) evaluation numbers and sizes of separated amplicons obtained by PCR from a known E. coli strain. M1 is useful for
                                                                                                                                                                                                                                 The present invention describes a molecular sub-typing system (S) for Bscherichia coli, which comprises observing and recording variable number tandem repeats (VMTR) repeat arrays in an E. coli DNA sample. Also described: (1) WNTR loci (I) for sub-typing E. coli O157:H7; (2) primers (II) for amplifying (I); (3) amplicon comprising (II) and a locus comprising a WNTR sequence from E. coli O157:H7; (4) multiplex cocktails (III) for multiplex amplification of (I) comprising two or more primers of (III); (5) kits for molecular sub-typing of E. coli O157:H7 by PCR comprising primers for WNTR loci in E. coli, and amplifying reagents for maintaining hybridisation and amplification condition in a PCR instrument with DNA from an E. coli strain; (6) kits for molecular sub-typing of E. coli O157:H7 strains by multiplex, comprising (III), and amplifying reagents for maintaining hybridisation and amplification condition in a multiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub-typing of III) and amplifying reagents for maintaining hybridisation and amplification condition in a multiplex instrument with DNA from an E. coli O157:H7 strain; and (7) sub-typing of E. coli o157:H7 strain sub-typing of E. coli o157:H7 strain sub-typing of E. co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   molecular sub-typing system; Escherichia coli; variable number tandem repeat; VNTR; genetic data; epidemiological database; research; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Molecular sub-typing system for Escherichia coli, comprises observing and recording variable number tandem repeat arrays in an Escherichia coli DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Escherichia coli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     នន្តន្តន្តន្ត្
         The invention relates to an isolated nucleic acid (N1) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive of isolated with a glaucoma or to a progressive ocular hypertensive or progression of glaucoma in a patient, comprising providing applification reaction primers that direct amplification of a selected amplification of a selected containing the presence of inthe net application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
Best Local :
                            The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism obtained from a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, detecting the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive disorder resulting in loss of visual field in a patient (or the severity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             promoter and amplifying the DNA) and detecting a polymorphism (comprising obtaining a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09-OCT-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            glaucoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amplification reaction primers that direct amplification of a select pucleic acid region containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (compobtaining a sample containing human genomic DNA, providing a nuclei capable of detecting a SNP located within an optineurin promoter, a detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 16
                       The present invention discloses a method for generating five prime biased tandem tag libraries of cDNAs. The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags. The present sequence is human NADH dehydrogenase (ubiquinone) Fe-S protein 8 (NADH-coenzyme Q reductase; NDUFS8) tandem tag DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tandem tag; concatenated tag; human; NADH dehydrogenase; Fe-S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    putative regulatory region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present sequence is an optineurin promoter motif, repeat element
Sequence 16
                                                                                                                                                Generating five prime biased tandem tag libraries of cDNAs by isola sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating

                                                               Human ribosomal protein S21 (RPS21) tandem
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 16 BP; 5 A; 6 C; 1 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention discloses a method for generating five prime biased tandem tag libraries of CDNAs. The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tandem tag; concatenated tag;

The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags. The present sequence is human ribosomal protein tandem tag DNA

probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undestred sequences in an assa for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the mixture of probes (preferably detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the target genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention discloses a metho trandem tag libraries of CDNAs. The step mRNAs, amplifying the released tags, co form concatenated tags, amplifying and The present sequence is human tandem tage.

The hybridization of the genomic array is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that that hybridization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              more detectable nucleic acid probes to the target genomic nucleic acid c the sample. The genomic nucleic acid is contained in a fixed tissue or a cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic arrays. The genomic array comprises nucleic acid that is prepared from Bacterial Artificial Chromosome (BAC) clones. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 16
                                                                                                                                                                                        WPI;

homologous acid.

Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic

Claim 10; SEQ ID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    control genomic involence acray with the sample and control genomic nucleic acid and, the array with the sample and control genomic nucleic acid and, the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the sample as compared with the relative copy numbers of sequences in the control. The hybridization of the genomic determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic arrays. The genomic array comprises nucleic acid that is prepared from the control are intercable acid and that is prepared from the control array is determined by determining the presence formerce.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

The genomic nucleic acid is contained in a fixed tissue or a cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid withe that of a control sample using a sample of genomic nucleic acid with the method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the array or both the sample and control genomic nucleic acid, which are differentially labelled, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one nucleic acid of the sample by determining the hybridization of the one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay

```
cc encoded by the nucleic acid, an isolated antibody that specifically correcognises the delta opioid receptor variant, a vector comprising the culcic acid, a host cell transformed to contain the vector, producing cc nucleic acid, a host cell transformed to contain the vector, producing cc the polypeptide by culturing the host cell, identifying an agent which cc modulates the expression of the nucleic acid, diagnosing a genetic correction of the nucleic acid, diagnosing a genetic correction of the presence of the variant nucleic acid in a patient sample, can allele specific primer that detects a polymorphism in the gene ce encoding a delta opioid receptor associated with an eating or energy contain the variant nucleic acids. The variants are named OppDI-1 to contain the variant nucleic acids. The variants are named OppDI-1 to contain the variant opioid receptor gene is located on chromosome 1. The nucleic acid molecules and delta opioid receptor variant are useful for contains a genetic predisposition to an eating or energy homeostasis contains a genetic predisposition to an eating or energy homeostasis contains a such as anorexia nervosa. The allele specific primer is useful contains the disorder cited. The present sequence is a genotyping contains the disorder cited. The present sequence is a genotyping contains an entire of the contains and contains and contains a contain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated nucleic acid molecule comprising a variant gene associated with an eating disorder and selected from any of 119 polymorphisms with their corresponding genotyping in dataset, alleles and HGBASE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular anorexia nervosa and bulimia nervosa. This polymorlectide

associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to
                                                                                     allergies. Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              positions 221931-22334 of GemBank RL670399, 31673-3359 of RL663116, or 44731-43231 or 36616-33151 of AF168787 and is involved in transmission of pain, particularly in primary sensory neurons. The involved in transmission of describes a vector that contains the VR1 modulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulating expression of the VR1 receptor by introducing the modulator or the vector into a cell that contains the VR1 gene. The modulator or the vector into a cell that contains the VR1 gene. The products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded coligonucleotide fragment of it), e.g. by Western blotting or enzymelinked immunosorbant assay, particularly for diagnosis of diseases a binding site for a transcription or underexpression of the transcription factor. The region that modulates VR1 receptor expression includes a binding site for a transcription factor, e.g. MZF1, NFKappaB, NFAT or GATA1. The nucleic acids of the invention, or vectors containing them, can used for prevention or treatment of pain, also for treating sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and myalgia, that are associated with activity of the VR1 which is capable of hidding treatment of factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic, ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (i.e. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 11 primer pairs are shown in AAQ95841-82. The published size range of the D13S217 allele is 160-174 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intethroughout the human genome which can be detectably labelled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kit for automated genotyping contg. pairs of PCR primers - designed amplify polymorphic nucleotide repeat sequences, arranged in sets with a characteristic fluorescence label, useful e.g. in detection

The ribozyme of the invention are used for modulating the synthesis, expression and/or CC integrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related composition of tuberous sclerosis, port-wine stains, Sturge Weber angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber considering and archiver-Bending and archiver-Bending and archiver and archiver and and archivers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   멍

The present invention describes enzymatic nucleic acid molecules with RNA cc cleaving activity, which specifically cleave RNA encoded by an aryl converse of the present respect of the present ribration and the present respect of the present and the print subunit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to cc AAA17167 and AAA17561 to AAA17622 represent ribration gene esquences for ARNT, cc and AAA17168 to AAA17560 and AAA17622 represent ribration to cc corresponding target sequences, AAA17685 to AAA18385 and AAA19087 to cc AAA19154 represent ribration sequences, AAA17685 to AAA18386 to AAA19086 cc AAA19154 represent ribration sequences, and AAA18386 to AAA19086 cc and AAA19155 to AAA19222 represent their corresponding target sequences, cc AAA19233 to AAA20361 and AAA21501 to AAA21555 represent ribration and cc gequences for integrin alpha 6 subunit, and AAA2036 to AAA21500 and cc AAA21596 to AAA21688 represent their corresponding target sequences; cc AAA21689 to AAA22475 and AAA23363 to AAA23342 represent ribration sequence of cc for integrin subunit beta 3, and AAA23476 to AAA23262, AAA23343 to AAA23343 to AAA23476 to AAA23476 to AAA23343 to AAA23343 to AAA23476 to AAA23476 to AAA23343 to AAA23476 to AAA23476 to AAA23343 to AAA23476 to AAA23476 to AAA23476 to AAA23476 to AAA23476 to AAA23343 to AAA23476 to
                                                                   AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   305pp; English.

CC hydrocarbon nuclear transporter (ARMT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie 2 gene. AAA16775 to AAA17622 represent ribozyme sequences for ARMT. CC corresponding target sequences; AAA17685 to AAA16385 and AAA19087 to CC corresponding target sequences; AAA17685 to AAA13836 and AAA19087 to CC AAA19154 represent ribozyme sequences; AAA17685 to AAA18386 to AAA19086 cC AAA19154 represent ribozyme sequences for Tie-2, and AAA18186 to AAA19086 cC AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme cC sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21689 represent their corresponding target sequences; CC AAA21596 to AAA22475 and AAA2363 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23343 to CC AAA2342 represent their corresponding target sequences. The ribozymes of the invention are used for modulating target sequences. The ribozymes of corresponding subunit beta 3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related corresponding represent cancer, diabetic retinopathy, age related corresponding subunit alpha-6, or Tie-2. They are neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, candiofibroma of tuberous sclerosis, pot-wise stains, Sturge Weber candions solverome. Weber sendu syndrome.

CC hydrocarbon nuclear transporter (ARNT) gene, an integrin albha 6 subunit gene, or a Tie-2 gene. AAA17757 to

CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT,

CC and AAA17168 to AAA17560 and AAA17633 to AAA17684 represent their

CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to

CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to

CC aAA19155 to AAA19222 represent their corresponding target sequences;

CC aAA19233 to AAA2361 and AAA21501 to AAA21595 represent ribozyme

CC AAA19233 to AAA2361 and AAA21501 to AAA21595 represent ribozyme

CC AAA21698 to AAA21688 represent their corresponding target sequences;

CC AAA21689 to AAA21675 and AAA23263 to AAA2332 represent ribozyme sequence

CC AAA21689 to AAA22475 and AAA23263 to AAA2332 represent ribozyme so

CC AAA21689 to AAA22475 and AAA23263 to AAA2332 represent ribozymes of

CC AAA21689 to AAA22475 and AAA23263 to AAA23343 to

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 to AAA23343 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 represent ribozymes of

CC CAA21689 to AAA22475 and AAA23263 represent ribozymes of

CC CAA21689 to AAA2476 to AAA23476 to AAA234343 to

CC CAA21689 to AAA2476 to AAA23476 to AAA234343 to

CC CAA21689 to AAA2476 to AAA23476 to

CC cleaving accivity, which specifically there are submit beta 3 pydrocarbon nuclear transporter (ARNY) gene, an integrin submit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNY, can AAA17168 to AAA17168 to AAA17168 represent their cc corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19125 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21595 to AAA21488 represent their corresponding target sequences; AAA19223 to AAA22475 and AAA22363 to AAA23362 to AAA23362 to AAA23363 to AAA2363 to AAA2363 to AAA2363 to AAA2363 to AAA2363 to AAA2363 to AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome;

                                                                                                                                                                                          The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19086 CC and AAA19155 to AAA19222 represent their corresponding target sequences; CC AAA19232 to AAA21501 to AAA21501 to AAA21502 represent ribozyme CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA22475 and AAA2363 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA2362, AAA23343 to CC aAA33422 represent their corresponding target sequences. The ribozyme of the invention are used for modulating the synthesis, expression and/or CC cabality of an mRNA encoding angiogenic factor, especially ARNT, CC especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as cc especially come, kippel-Trenaunay-Weber syndrome, Sturge Weber CC and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                            Query Match

The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17188 to AAA17680 and AAA17685 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19386 to AAA19086 CC and AAA19155 to AAA12222 represent their corresponding target sequences; CC AAA19223 to AAA21501 to AAA21501 to AAA21502 represent ribozyme sequences; CC AAA19223 to AAA21501 and AAA21501 to AAA2155 represent ribozyme sequences; CC AAA21589 to AAA21688 represent their corresponding target sequences; CC AAA21589 to AAA22163 and AAA23263 to AAA23237 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to AAA23422 represent their corresponding target sequences. The ribozyme sof CC AAA21689 to AAA22475 and AAA23263 to AAA2342 represent ribozyme sof CC AAA21689 to AAA22475 and AAA23263 to AAA23343 to AAA23422 represent ribozyme sof CC CAAA21689 to AAA22475 and AAA23263 to AAA23422 represent ribozyme sof CC CAAA21689 to AAA23422 represent their corresponding target sequences. The ribozyme sof CC CAAA21689 to AAA23422 represent their corresponding target sequence The ribozyme sof CC CAAA21689 to AAA23420 and AAA23423 represent ribozyme sof CC CAAA23422 represent their corresponding target sequence The ribozyme sof CC CAAA23422 represent their corresponding target sequence The ribozyme sof CC CAAA23422 represent their corresponding target sequence of The ribozyme sof CC CAAA23423 and CC CAAA2342 represent their corresponding target sequence of The ribozyme sof CC CAAA2344 and CC C

                                                                                                                                                                                                                                                                                                                                                                                     cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17560 and AAA17623 to AAA17884 represent their corresponding target sequences; AAA17885 to AAA18385 and AAA19087 to AAA19184 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21508 to AAA21688 represent their corresponding target sequences; AAA21596 to AAA21688 represent their corresponding target sequences; AAA21596 to AAA22367 and AAA23363 to AAA23363 AAA23363 to AAA23363 AAA23363 To AAA23363 AAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss
                                                                                       AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNY, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 1999-591315/50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                  The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl C cleaving activity, which specifically cleave RNA encoded by an aryl C cleaving nuclear transporter (ARNT) gene, an integrin subunit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, C corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19386 to AAA19086 cc and AAA19155 to AAA19222 represent their corresponding target sequences; C AAA191523 to AAA21591 to AAA21591 to AAA21595 to AAA21595 to AAA21595 represent ribozyme sequences; c AAA21595 to AAA21596 to AAA21598 represent their corresponding target sequences; c AAA21689 to AAA22168 represent their corresponding target sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to C AAA23422 represent their corresponding target sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to C AAA23422 represent their corresponding target sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to C AAA23422 represent their corresponding target sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to C AAA23422 represent their corresponding target sequence for integrin subunit beta 3, and AAA22476 to AAA23363 represent ribozymes of the invention are used for modulating the synthesis, expression and/or c integrin subunit beta 3, integrin subunit alpha 6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related c macular degeneration (ARMD), inflammation, and arthritis, as well as meld as a self-cosis, pot-wine stains, Sturge Weber c spiderome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 2181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiotibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic;
